## FUSED PYRAZOLE DERIVATIVES AND METHODS OF TREATMENT OF METABOLIC-RELATED DISORDERS THEREOF

### 5 FIELD OF THE INVENTION

The present invention relates to certain fused pyrazole derivatives, and pharmaceutically acceptable salts thereof, which exhibit useful pharmacological properties, for example as agonists for the nicotinic acid receptor, RUP25. Also provided by the present invention are pharmaceutical compositions containing one or more compounds of the invention, and methods of using the compounds and compositions of the invention in the treatment of metabolic-related disorders, including dyslipidemia, atherosclerosis, coronary heart disease, insulin resistance, type 2 diabetes, Syndrome-X and the like. In addition, the present invention also provides for the use of the compounds of the invention in combination with other active agents such as those belonging to the class of  $\alpha$ -glucosidase inhibitors, aldose reductase inhibitors, biguanides, HMG-CoA reductase inhibitors, squalene synthesis inhibitors, fibrates, LDL catabolism enhancers, angiotensin converting enzyme (ACE) inhibitors, insulin secretion enhancers, thiazolidinedione, DP receptor antagonists and the like.

### BACKGROUND OF THE INVENTION

#### 20 Compounds of the invention as Antilipolytic Agents

Atherosclerosis and stroke are the numbers one and number three leading causes of death of both men and women in the United States. Type 2 diabetes is a public health problem that is serious, widespread and increasing. Elevated levels of low density lipoprotein (LDL) cholesterol or low levels of high density lipoprotein (HDL) cholesterol are, independently, risk factors for atherosclerosis and associated cardiovascular pathologies. In addition, high levels of plasma free fatty acids are associated with insulin resistance and type 2 diabetes. One strategy for decreasing LDL-cholesterol, increasing HDL-cholesterol, and decreasing plasma free fatty acids is to inhibit lipolysis in adipose tissue. This approach involves regulation of hormone sensitive lipase, which is the rate-limiting enzyme in lipolysis. Lipolytic agents increase cellular levels of cAMP, which leads to activation of hormone sensitive lipase within adipocytes. Agents that lower intracellular cAMP levels, by contrast, would be antilipolytic.

It is also worth noting in passing that an increase in cellular levels of cAMP down-regulates the secretion of adiponectin from adipocytes [Delporte, ML *et al. Biochem J* (2002) July]. Reduced levels of plasma adiponectin have been associated with metabolic-related disorders, including atherosclerosis, coronary heart disease, insulin resistance and type 2 diabetes [Matsuda, M *et al. J Biol Chem* (2002) July and reviewed therein].

Nicotinic acid (niacin, pyridine-3-carboxylic acid) is a water-soluble vitamin required by the human body for health, growth and reproduction; a part of the Vitamin B complex. Nicotinic acid is also one of the oldest used drugs for the treatment of dyslipidemia. It is a valuable drug in that it favorably affects virtually all of the lipid parameters listed above [Goodman and Gilman's Pharmacological Basis of Therapeutics, editors Harmon JG and Limbird LE, Chapter 36, Mahley RW and Bersot TP (2001) pages 971-1002]. The benefits of nicotinic acid in the treatment or prevention of atherosclerotic cardiovascular disease have been documented in six major clinical trials [Guyton JR (1998) *Am J Cardiol* 82:18U-23U]. Nicotinic acid and related derivatives, such as, acipimox have recently been discussed [Lorenzen, A et al (2001) *Molecular Pharmacology* 59:349-357]. Structure and synthesis of additional analogs or derivatives of nicotinic acid are discussed throughout the Merck Index, An Encyclopedia of Chemicals, Drugs, and Biologicals, Tenth Edition (1983), which is incorporated herein by reference in its entirety.

Nicotinic acid inhibits the production and release of free fatty acids from adipose tissue, likely via an inhibition of adenylyl cyclase, a decrease in intracellular cAMP levels, and a concomitant decrease in hormone sensitive lipase activity. Agonists that down-regulate hormone sensitive lipase activity leading to a decrease in plasma free fatty acid levels are likely to have therapeutic value. The consequence of decreasing plasma free fatty acids is two-fold. First, it will ultimately lower LDL-cholesterol and raise HDL-cholesterol levels, independent risk factors, thereby reducing the risk of mortality due to cardiovascular incidence subsequent to atheroma formation. Second, it will provide an increase in insulin sensitivity in individuals with insulin resistance or type 2 diabetes. Unfortunately, the use of nicotinic acid as a therapeutic is partially limited by a number of associated, adverse side-effects. These include flushing, free fatty acid rebound, and liver toxicity.

The rational development of novel, nicotinic acid receptor agonists that have fewer side-effects will be valuable, but to date this has been hindered by the inability to molecularly identify the nicotinic acid receptor. Furthermore, other receptors of the same class may exist on the surface of adipocytes and similarly decrease hormone sensitive lipase activity through a reduction in the level of intracellular cAMP but without the elicitation of adverse effects such as flushing, thereby representing promising novel therapeutic targets. Recent work suggests that nicotinic acid probably acts through a specific GPCR [Lorenzen A, et al. (2001) *Molecular Pharmacology* 59:349-357 and reviewed therein]. Further work has suggested that the effects of nicotinic acid on macrophages, spleen and probably adipocytes are mediated via this specific GPCR [Lorenzen A, et al. (2002) *Biochemical Pharmacology* 64:645-648 and reviewed therein].

## 10 CHEMISTRY OF THE PRESENT INVENTION

### Synthetic Procedures for the preparation of compounds of the present invention.

Some embodiments of the present invention pertain to synthetic processes for the preparation of novel fused pyrazoles of Formula (Ia). The compounds of the present invention can be readily prepared according to these novel processes utilizing a variety of starting materials that are commercially available or readily prepared by synthetic regimes which would be familiar to one skilled in the art. In the illustrated syntheses outlined below, unless stated otherwise, the labeled substituents have the same definitions as described herein.

One method that can be used to prepare compounds of the invention wherein X is N and Z is C-tetrazol-5-yl utilizes intermediates derived from the cyclic ketone of Formula (A) as illustrated in

20 Reaction Scheme I below:

Scheme I

Compounds of Formula (Ia) can be prepared by reacting a cyclic ketone of Formula (A) with a dialkyl oxalate of formula  $(C(O)OR_{10})_2$ , wherein  $R_{10}$  is a  $C_{1-6}$  alkyl, in the presence of a base and a polar solvent such as, but not limited to,  $C_{1-6}$  alkanol, methanol, ethanol, butanol, pentanol, hexanol, 2-methoxyethanol, isopropanol, THF, DMF and the like to give ketoester of Formula (B). Suitable bases include alkali metal alkoxides, for example, sodium methoxide, sodium ethoxide, potassium ethoxide, potassium *t*-butoxide, and the like; alkali metal amides (i.e., alkali metal- $NR_{11}$ , wherein  $R_{11}$  is  $C_{1-6}$  alkyl or silyl- $C_{1-6}$ -alkyl), for example, lithium diisopropylamide, lithium hexamethyldisilazide, sodium hexamethyldisilazide, potassium hexamethyldisilazide and like bases. Ketoester (B) is reacted with hydrazine, either protected or unprotected hydrazine can be used, under suitable conditions to give pyrazole esters of Formula (C). Optionally, the pyrazole can be protected, for example, with a benzyl group and the like. Subsequently, the ester is converted to amide of Formula (D) using methods known to one of skill in the art, for example, treating with ammonia in a polar solvent at temperature from room temperature to the boiling point of the solvent. Amide (D) is reacted with a dehydrating reagent, such as phosphorous oxychloride, phosphorous pentoxide, thionyl chloride, trifluoroacetic anhydride and the like, either neat or in the presence of a nonprotic solvent, such as acetonitrile, DMF, and the like, to give nitrile (E). Nitrile (E) is reacted with an azide (i.e.,  $N_3$ ) or azide equivalent, such as, sodium azide, potassium azide, trimethylsilyl azide (i.e.,  $(CH_3)_3SiN_3$ ), and the like to give compounds of Formula (Ia) wherein X is N and Z is C-tetrazol-5-yl.

In some instances it can be beneficial to include the presence of a Lewis acid, for example,  $AlCl_3$ ,  $ZnBr_2$ , and the like, in a suitable solvent, such as, DMF and the like.

Other compounds of the invention wherein X is N and Z is  $C-CO_2H$  or Z is N and X  $C-CO_2H$  can be prepared from intermediate C by hydrolysis to the corresponding acids of Formula (Ic) by lithium hydroxide, sodium hydroxide, potassium hydroxide, potassium trimethylsilanoate or the like. This process is illustrated below for the embodiments wherein X is N and Z is  $C-CO_2H$ .

A similar process can also be illustrated for embodiments of the present invention wherein X is  $C-CO_2H$  and Z is N.

In a similar manner as described above in Scheme I, compounds of the present invention, wherein Z is N and X is C-tetrazolyl or C-CO<sub>2</sub>H or C-CO<sub>2</sub>-C<sub>1-6</sub>-alkyl, can be prepared using ketone (F).

Compounds of Ketone (F) can be prepared by cyclopropanation of the appropriate cyclopentenol by treating with an appropriate carbene or carbenoid generating reagent, such as, but not limited to, diiodoethane with diethylzinc, dibromomethane and sodium hydroxide, and the like. The carbene or carbenoid generating reagent can be selected with the appropriate substitution to either directly introduce R<sub>2</sub> and R<sub>3</sub> to Ketone (F) or to introduce group(s) (i.e., represented by R<sub>12</sub> and R<sub>13</sub>) that can be subsequently converted into R<sub>2</sub> and R<sub>3</sub> groups using methods known in the art. The cyclopentyl alcohol can be oxidized to the cyclic ketone by oxidizing agents such as pyridinium chlorochromate, tetrapropylammonium perruthenate, and like oxidizing agents. This process is illustrated below.

Compounds can be prepared by treating an appropriately substituted suitable 1,2-epoxy-5,6-alkene with a strong base such as lithium tetramethylpiperazide, lithium diisopropylamide, lithium hexamethyldisilazane, sodium hexamethyldisilazane, potassium hexamethyldisilazane and like bases to give Alcohol (M), see Hodson, et al. *J. Am. Chem. Soc.* 2004, 126, 8664. Subsequently, the alcohol can be converted to Ketone (L) using an oxidizing agent, such as, but not limited to, pyridinium chlorochromate, tetrapropylammonium perruthenate, and the like.

Chiral (non-racemic) compounds of the invention can be prepared by kinetic hydrolytic resolution of the Epoxide (G) using the published method (Schaus, S. E.; Brandes, B. D.; Larrow, J. F.; Tokunga, M.; Hansen, K. B.; Gould, A. E.; Furrow, M. E.; Jacobsen, E. N. *J. Am. Chem. Soc.* 2002, 124, 1307).

Alternatively, other substituted Ketones (L) can be prepared by addition of the anion generated by reaction of trimethylsulfoxonium iodide and a suitable base like sodium hydride, potassium hydride, and the like to an appropriate cyclopentenone.

Another method that can be used to prepare compounds of the present invention, wherein X or Z is C-tetrazol-5-yl, is described here. This method allows the option of directly introducing the tetrazol-5-yl group without the need of using multiple steps or an azide reagent. This method is illustrated in the scheme below wherein X is N and Z is C-tetrazol-yl:

A suitably substituted Ketone (A) can be converted to Diketone (O) using Tetrazole (P) in the presence of base, where PG is a suitable protecting group or metal cation. A suitable base for use in the reaction is one that is soluble in the solvent and can remove a proton from the cyclopentanone, but does not otherwise participate in the reaction. Strong organic bases are particularly useful, such as DBU, DBN, tetramethylguanidine or alkali or alkaline earth metal bases, such as sodium or magnesium alkoxides, and particularly potassium butoxide. Suitable leaving groups (i.e., LG)

include groups that can be displaced without affecting the stability of the Tetrazole (P) or the resulting Diketone (O), some examples include esters (C<sub>1-4</sub> alkoxy or substituted benzyloxy). Suitable solvents include dimethylformamide (DMF), dimethylacetamide (DMAC) dimethylsulfoxide (DMSO), N-methylpyrrolidinone (NMP), and HMPT as well as tetrahydrofuran (THF). In the same reaction or as an additional step after isolation, Diketone (O) is converted to Tetrazole (Q) using hydrazine. The protecting group is subsequently removed to provide compounds of the present invention.

A similar process can also be illustrated for embodiments of the present invention wherein X is C-tetrazol-5-yl and Z is N.

10

The various organic group transformations and protecting groups utilized herein can be performed by a number of procedures other than those described above. References for other synthetic procedures that can be utilized for the preparation of intermediates or compounds disclosed herein can be found in, for example, Smith, M. B.; and March, J., *Advanced Organic Chemistry*, 5<sup>th</sup> Edition, Wiley-Interscience (2001); Larock, R.C., *Comprehensive Organic Transformations, A Guide to Functional Group Preparations*, 2<sup>nd</sup> Edition, VCH Publishers, Inc. Racemic mixtures can be resolved into the optical pure enantiomers by known methods, for example, by separation of diastereomeric salts thereof with an optically active acid, and liberating the optically active amine compound by treatment with a base or separation of diastereomeric salts with an optically active base and subsequently liberating the acid by treatment with an acid. Another method for resolving racemates into the optical pure enantiomers is based upon chromatography on an optically active matrix or chiral support. Certain racemic compounds of the present invention can thus be resolved into their optical antipodes, e.g., by fractional crystallization of d- or l- (tartrates, mandelates, or camphorsulphonate) salts for example. The compounds of the present invention can be resolved by the formation of diastereomeric amides or esters by reaction of the compounds of the present invention with an optically active amine or alcohol, such as, but not limited to, (+) or (–) α-

25

methylbenzylamine, (+) or (–)  $\alpha$ -methylbenzylalcohol, and the like, separated via fractional recrystallization, chiral chromatography or similar method, and subsequently hydrolyzed.

Additional methods for the resolution of optical isomers known to those skilled in the art can be used and will be apparent to the average worker skilled in the art. Such methods include those  
5 discussed by J. Jaques, A. Collet, and S. Wilen in "Enantiomers, Racemates, and Resolutions", John Wiley and Sons, New York (1981).

It is understood that the chemistry described herein is representative and is not intended to be limiting in any manner.

Another aspect of the present invention pertains to methods of producing a pharmaceutical  
10       composition comprising admixing or combining a compound of Formula (Ia), as described herein,  
and a pharmaceutically acceptable carrier.

### Compositions of the Present Invention

Some embodiments of the present invention include pharmaceutical compositions  
15       comprising a compound according to Formula (Ia) in combination with a pharmaceutically  
acceptable carrier.

Some embodiments of the present invention include a method of producing a pharmaceutical  
composition comprising admixing at least one compound according to any of the compound  
embodiments disclosed herein and a pharmaceutically acceptable carrier.

20       Formulations can be prepared by any suitable method, typically by uniformly mixing the  
active compound(s) with liquids or finely divided solid carriers, or both, in the required proportions,  
and then, if necessary, forming the resulting mixture into a desired shape.

Conventional excipients, such as binding agents, fillers, acceptable wetting agents, tableting  
lubricants, and disintegrants can be used in tablets and capsules for oral administration. Liquid  
25       preparations for oral administration can be in the form of solutions, emulsions, aqueous or oily  
suspensions, and syrups. Alternatively, the oral preparations can be in the form of dry powder that  
can be reconstituted with water or another suitable liquid vehicle before use. Additional additives  
such as suspending or emulsifying agents, non-aqueous vehicles (including edible oils),  
preservatives, and flavorings and colorants can be added to the liquid preparations. Parenteral dosage  
30       forms can be prepared by dissolving the compound of the invention in a suitable liquid vehicle and  
filter sterilizing the solution before filling and sealing an appropriate vial or ampoule. These are just  
a few examples of the many appropriate methods well known in the art for preparing dosage forms.

A compound of the present invention can be formulated into pharmaceutical compositions  
using techniques well known to those in the art. Suitable pharmaceutically-acceptable carriers,  
35       outside those mentioned herein, are known in the art; for example, see Remington, The Science and  
Practice of Pharmacy, 20<sup>th</sup> Edition, 2000, Lippincott Williams & Wilkins, (Editors: Gennaro, A. R.,  
*et al.*).

While it is possible that a compound for use in the treatment of the present invention may, in an alternative use, be administered as a raw or pure chemical, it is preferable however to present the compound or "active ingredient" as a pharmaceutical formulation or composition further comprising a pharmaceutically acceptable carrier. Therefore, one aspect of the present invention encompasses pharmaceutical compositions comprising a pharmaceutically acceptable carrier in combination with at least one compound according to Formula (Ia).

The invention provides pharmaceutical formulations comprising a compound of the invention, or a pharmaceutically acceptable salt, hydrate or solvate thereof, together with one or more pharmaceutically acceptable carriers therefor. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not overly deleterious to the recipient thereof.

Pharmaceutical formulations include those suitable for oral, rectal, nasal, topical (including buccal and sub-lingual), vaginal or parenteral (including intramuscular, sub-cutaneous and intravenous) administration or in a form suitable for administration by inhalation, insufflation or by a transdermal patch. Transdermal patches dispense a drug at a controlled rate by presenting the drug for absorption in an efficient manner with a minimum of degradation of the drug. Typically, transdermal patches comprise an impermeable backing layer, a single pressure sensitive adhesive and a removable protective layer with a release liner. One of ordinary skill in the art will understand and appreciate the techniques appropriate for manufacturing a desired efficacious transdermal patch based upon the needs of the artisan.

The compounds of the invention, together with a conventional adjuvant, carrier, or diluent, may thus be placed into the form of pharmaceutical formulations and unit dosages thereof, and in such form can be employed as solids, such as tablets or filled capsules, or liquids such as solutions, suspensions, emulsions, elixirs, gels or capsules filled with the same, all for oral use, in the form of suppositories for rectal administration; or in the form of sterile injectable solutions for parenteral (including subcutaneous) use. Such pharmaceutical compositions and unit dosage forms thereof may comprise conventional ingredients in conventional proportions, with or without additional active compounds or principles, and such unit dosage forms may contain any suitable effective amount of the active ingredient commensurate with the intended daily dosage range to be employed.

For oral administration, the pharmaceutical composition can be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are capsules, tablets, powders, granules or a suspension, with conventional additives such as lactose, mannitol, corn starch or potato starch; with binders such as crystalline cellulose, cellulose derivatives, acacia, corn starch or gelatins; with disintegrators such as corn starch, potato starch or sodium carboxymethyl-cellulose; and with lubricants such as talc or magnesium stearate. The active

ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water can be used as a suitable pharmaceutically acceptable carrier.

Compounds of the present invention, or a pharmaceutically acceptable salt, hydrate or solvate thereof, can be used as active ingredients in pharmaceutical compositions, specifically as  
5 RUP25 receptor agonists/partial agonists. The term "active ingredient" is defined in the context of a "pharmaceutical composition" and shall mean a component of a pharmaceutical composition that provides the primary pharmacological effect, as opposed to an "inactive ingredient" which would generally be recognized as providing essentially no pharmaceutical benefit.

The dose when using the compounds of the present invention can vary within wide limits,  
10 and as is customary and is known to the physician, it is to be tailored to the individual conditions in each individual case. It depends, for example, on the nature and severity of the illness to be treated, on the condition of the patient, on the compound employed or on whether an acute or chronic disease state is treated is conducted or on whether further active compounds are administered in addition to the compounds of the present invention. Representative doses of the present invention include, but  
15 not limited to, about 0.001 mg to about 5000 mg, about 0.001 to about 2500 mg, about 0.001 to about 1000 mg, 0.001 to about 500 mg, 0.001 mg to about 250 mg, about 0.001 mg to 100 mg, about 0.001 mg to about 50 mg, and about 0.001 mg to about 25 mg. Multiple doses can be administered during the day, especially when relatively large amounts are deemed to be needed, for example 2, 3 or 4, doses. Depending on the individual and as deemed appropriate from the patient's physician or care-  
20 giver it may be necessary to deviate upward or downward from the doses described herein.

The amount of active ingredient, or a pharmaceutically acceptable salt, hydrate or solvate thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient. Accordingly, the amount used will ultimately be at the discretion of the attendant physician  
25 or clinician. In general, one skilled in the art understands how to extrapolate *in vivo* data obtained in a model system to another, for example, an animal model to a human. Typically, animal models include, but are not limited to, the rodent diabetes models as described in Example 1, *infra*; the mouse atherosclerosis model as described in Example 2, *infra*; or the *in vivo* animal atherosclerosis model as described in Example 5, *infra*. In some circumstances, these extrapolations may merely be  
30 based on the weight of the animal model in comparison to another, such as, a mammal and preferably a human. However, more often, these extrapolations are not simply based on weight differences, but rather incorporate a variety of factors. Representative factors include the type, age, weight, sex, diet and medical condition of the patient, the severity of the disease, the route of administration, pharmacological considerations such as the activity, efficacy, pharmacokinetic and toxicology  
35 profiles of the particular compound employed, whether a drug delivery system is utilized, on whether an acute or chronic disease state is being treated, on whether further active compounds are administered in addition to the compounds of the present invention as part of a combination therapy.

The dosage regimen for treating a disease condition with the compounds and/or compositions of this invention is selected in accordance with a variety of factors, such as, those cited above. Thus, the actual dosage regimen employed may vary widely and therefore may deviate from a preferred dosage regimen and one skilled in the art will recognize that dosage and dosage regimen outside these typical ranges can be tested and, where appropriate, can be used in the methods of this invention.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself can be further divided, e.g., into a number of discrete loosely spaced administrations. The daily dose can be divided, especially when relatively large amounts are administered as deemed appropriate, into several, for example 2, 3 or 4, part administrations. If appropriate, depending on individual behavior, it can be necessary to deviate upward or downward from the daily dose indicated.

The compounds of the present invention can be administered in a wide variety of oral and parenteral dosage forms. It will be obvious to those skilled in the art that the following dosage forms may comprise, as the active component, either a compound of the invention or a pharmaceutically acceptable salt of a compound of the invention.

For preparing pharmaceutical compositions from the compounds of the present invention, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavouring agents, solubilizers, lubricants, suspending agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component.

In tablets, the active component is mixed with the carrier having the necessary binding capacity in suitable proportions and compacted to the desired shape and size.

The powders and tablets may contain varying percentage amounts of the active compound. A representative amount in a powder or tablet may contain from 0.5 to about 95 percent of the active compound; however, an artisan would know when amounts outside of this range are necessary. Suitable carriers for powders and tablets are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like.

The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component, with or without carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as an admixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool, and thereby to solidify.

5        Formulations suitable for vaginal administration can be presented as pessaries, tampons, creams, gels, pastes, foams or sprays containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

      Liquid form preparations include solutions, suspensions, and emulsions, for example, water or water-propylene glycol solutions. For example, parenteral injection liquid preparations can be  
10        formulated as solutions in aqueous polyethylene glycol solution. Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions can be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable  
15        vehicles and solvents that can be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

      The compounds according to the present invention may thus be formulated for parenteral  
20        administration (e.g. by injection, for example bolus injection or continuous infusion) and can be presented in unit dose form in ampoules, pre-filled syringes, small volume infusion or in multi-dose containers with an added preservative. The compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient can be in  
25        powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution, for constitution with a suitable vehicle, e.g. sterile, pyrogen-free water, before use.

      Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavours, stabilizing and thickening agents, as desired.

      Aqueous suspensions suitable for oral use can be made by dispersing the finely divided  
30        active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, or other well known suspending agents.

      Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component,  
35        colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

For topical administration to the epidermis the compounds according to the invention can be formulated as ointments, creams or lotions, or as a transdermal patch.

Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Lotions can be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilizing agents,  
5 dispersing agents, suspending agents, thickening agents, or coloring agents.

Formulations suitable for topical administration in the mouth include lozenges comprising active agent in a flavored base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatin and glycerin or sucrose and acacia; and  
10 mouthwashes comprising the active ingredient in a suitable liquid carrier.

Solutions or suspensions are applied directly to the nasal cavity by conventional means, for example with a dropper, pipette or spray. The formulations can be provided in single or multi-dose form. In the latter case of a dropper or pipette, this can be achieved by the patient administering an appropriate, predetermined volume of the solution or suspension. In the case of a spray, this can be  
15 achieved for example by means of a metering atomizing spray pump.

Administration to the respiratory tract may also be achieved by means of an aerosol formulation in which the active ingredient is provided in a pressurized pack with a suitable propellant. If the compounds of the Formula (Ia) or pharmaceutical compositions comprising them are administered as aerosols, for example as nasal aerosols or by inhalation, this can be carried out,  
20 for example, using a spray, a nebulizer, a pump nebulizer, an inhalation apparatus, a metered inhaler or a dry powder inhaler. Pharmaceutical forms for administration of the compounds of the Formula (Ia) as an aerosol can be prepared by processes well-known to the person skilled in the art. For their preparation, for example, solutions or dispersions of the compounds of the Formula (Ia) in water, water/alcohol mixtures or suitable saline solutions can be employed using customary additives, for  
25 example benzyl alcohol or other suitable preservatives, absorption enhancers for increasing the bioavailability, solubilizers, dispersants and others, and, if appropriate, customary propellants, for example include carbon dioxide, CFC's, such as, dichlorodifluoromethane, trichlorofluoromethane, or dichlorotetrafluoroethane; and the like. The aerosol may conveniently also contain a surfactant such as lecithin. The dose of drug can be controlled by provision of a metered valve.

30 In formulations intended for administration to the respiratory tract, including intranasal formulations, the compound will generally have a small particle size for example of the order of 10 microns or less. Such a particle size can be obtained by means known in the art, for example by micronization. When desired, formulations adapted to give sustained release of the active ingredient can be employed.

35 Alternatively the active ingredients can be provided in the form of a dry powder, for example, a powder mix of the compound in a suitable powder base such as lactose, starch, starch derivatives such as hydroxypropylmethyl cellulose and polyvinylpyrrolidone (PVP). Conveniently

the powder carrier will form a gel in the nasal cavity. The powder composition can be presented in unit dose form for example in capsules or cartridges of, e.g., gelatin, or blister packs from which the powder can be administered by means of an inhaler.

5 The pharmaceutical preparations are preferably in unit dosage forms. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

10 Tablets or capsules for oral administration and liquids for intravenous administration are preferred compositions. Such tablets and capsules typically contain from about 0.001 mg to about 1000 mg, about 0.001 mg to about 500 mg, or about 0.001 mg to about 250 mg of a compound of Formula (Ia).

Compounds of the present invention can be converted to "pro-drugs." The term "pro-drugs" 15 refers to compounds that have been modified with specific chemical groups known in the art and when administered into an individual these groups undergo biotransformation to give the parent compound. Pro-drugs can thus be viewed as compounds of the invention containing one or more specialized non-toxic protective groups used in a transient manner to alter or to eliminate a property of the compound. In general, the "pro-drug" approach is utilized to facilitate oral absorption. A 20 thorough discussion is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are hereby incorporated by reference in their entirety.

Suitable pharmaceutical agents that can be used in conjunction with compounds of the present invention include the HMG-CoA reductase inhibitors. The HMG-CoA reductase inhibitors are agents also referred to as Statin compounds that belong to a class of drugs that lower blood cholesterol levels by inhibiting hydroxymethylglutaryl CoA (HMG-CoA) reductase. HMG-CoA reductase is the rate-limiting enzyme in cholesterol biosynthesis. The statins lower serum LDL concentrations by upregulating the activity of LDL receptors and are responsible for clearing LDL from the blood. Some representative examples the statin compounds include rosuvastatin, pravastatin and its sodium salt, simvastatin, lovastatin, atorvastatin, fluvastatin, cerivastatin, pitavastatin, BMS's "superstatin", and HMG-CoA reductase inhibitors known in the art.

Suitable pharmaceutical agents that can be used in conjunction with compounds of the present invention include the angiotensin converting enzyme (ACE) inhibitors. The angiotensin converting enzyme inhibitors belong to the class of drugs that partially lower blood glucose levels as well as lowering blood pressure by inhibiting angiotensin converting enzymes. Examples of the angiotensin converting enzyme inhibitors include captopril, enalapril, alacepril, delapril; ramipril, lisinopril, imidapril, benazepril, ceronapril, cilazapril, enalaprilat, fosinopril, moveltopril, perindopril, quinapril, spirapril, temocapril, trandolapril, and angiotensin converting enzyme inhibitors known in the art.

Suitable pharmaceutical agents that can be used in conjunction with compounds of the present invention include the angiotensin II receptor antagonists. #### Labeled Compounds and Assay Methods

Another object of the present invention relates to radio-labeled compounds of Formula (Ia) and formulae related thereto that are useful not only in radio-imaging but also in assays, both in vitro and in vivo, for localizing and quantitating RUP25 in tissue samples, including human, and for identifying the RUP25 receptor ligands by inhibition binding of a radio-labeled compound. It is a further object of this invention to include novel RUP25 assays of which comprise such radio-labeled compounds.

The present invention embraces isotopically-labeled compounds of Formula (Ia) and any subgenera herein, such as but not limited to, Formulae (Ia) to (Io). An "isotopically" or "radio-labeled" compounds are those which are identical to compounds disclosed herein, but for the fact that one or more atoms are replaced or substituted by an atom having an atomic mass or mass number different from the atomic mass or mass number typically found in nature (i.e., naturally occurring). Suitable radionuclides that can be incorporated in compounds of the present invention include but are not limited to  $^2\text{H}$  (also written as D for deuterium),  $^3\text{H}$  (also written as T for tritium),  $^{11}\text{C}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{13}\text{N}$ ,  $^{15}\text{N}$ ,  $^{15}\text{O}$ ,  $^{17}\text{O}$ ,  $^{18}\text{O}$ ,  $^{18}\text{F}$ ,  $^{35}\text{S}$ ,  $^{36}\text{Cl}$ ,  $^{82}\text{Br}$ ,  $^{75}\text{Br}$ ,  $^{76}\text{Br}$ ,  $^{77}\text{Br}$ ,  $^{123}\text{I}$ ,  $^{124}\text{I}$ ,  $^{125}\text{I}$  and  $^{131}\text{I}$ . The radionuclide that is incorporated in the instant radio-labeled compounds will depend on the specific application of that radio-labeled compound. For example, for *in vitro* RUP25 labeling and competition assays, compounds that incorporate  $^3\text{H}$ ,  $^{14}\text{C}$ ,  $^{82}\text{Br}$ ,  $^{125}\text{I}$ ,  $^{131}\text{I}$ ,  $^{35}\text{S}$  or will generally be most useful. For radio-imaging applications  $^{11}\text{C}$ ,  $^{18}\text{F}$ ,  $^{125}\text{I}$ ,  $^{123}\text{I}$ ,  $^{124}\text{I}$ ,  $^{131}\text{I}$ ,  $^{75}\text{Br}$ ,  $^{76}\text{Br}$  or  $^{77}\text{Br}$  will generally be most useful.

It is understood that a "radio-labeled " or "labeled compound" is a compound of the present invention that has incorporated at least one radionuclide; in some embodiments the radionuclide is selected from the group consisting of  $^3\text{H}$ ,  $^{14}\text{C}$ ,  $^{125}\text{I}$ ,  $^{35}\text{S}$  and  $^{82}\text{Br}$ .

5 Certain isotopically-labeled compounds of the present invention are useful in compound and/or substrate tissue distribution assays. In some embodiments the radionuclide  $^3\text{H}$  and/or  $^{14}\text{C}$  isotopes are useful in these studies. Further, substitution with heavier isotopes such as deuterium (i.e.,  $^2\text{H}$ ) may afford certain therapeutic advantages resulting from greater metabolic stability (e.g., increased *in vivo* half-life or reduced dosage requirements) and hence can be preferred in some circumstances. Isotopically labeled compounds of the present invention can generally be prepared by  
10 following procedures analogous to those disclosed in the Schemes *supra* and Examples *infra*, by substituting an isotopically labeled reagent for a non-isotopically labeled reagent. Other synthetic methods that are useful are discussed *infra*. Moreover, it should be understood that all of the atoms represented in the compounds of the invention can be either the most commonly occurring isotope of such atoms or the more scarce radio-isotope or nonradio-active isotope.

15 Synthetic methods for incorporating radio-isotopes into organic compounds are applicable to compounds of the invention and are well known in the art. These synthetic methods, for example, incorporating activity levels of tritium into target molecules, and are as follows:

A. Catalytic Reduction with Tritium Gas - This procedure normally yields high specific activity products and requires halogenated or unsaturated precursors.

20 B. Reduction with Sodium Borohydride [ $^3\text{H}$ ] - This procedure is rather inexpensive and requires precursors containing reducible functional groups such as aldehydes, ketones, lactones, esters, and the like.

C. Reduction with Lithium Aluminum Hydride [ $^3\text{H}$ ] - This procedure offers products at almost theoretical specific activities. It also requires precursors containing reducible functional  
25 groups such as aldehydes, ketones, lactones, esters, and the like.

D. Tritium Gas Exposure Labeling - This procedure involves exposing precursors containing exchangeable protons to tritium gas in the presence of a suitable catalyst.

E. N-Methylation using Methyl Iodide [ $^3\text{H}$ ] - This procedure is usually employed to prepare O-methyl or N-methyl ( $^3\text{H}$ ) products by treating appropriate precursors with high specific activity  
30 methyl iodide ( $^3\text{H}$ ). This method in general allows for higher specific activity, such as for example, about 70-90 Ci/mmol.

Synthetic methods for incorporating activity levels of  $^{125}\text{I}$  into target molecules include:

A. Sandmeyer and like reactions - This procedure transforms an aryl or heteroaryl amine into a diazonium salt, such as a tetrafluoroborate salt, and subsequently to  $^{125}\text{I}$  labeled compound  
35 using  $\text{Na}^{125}\text{I}$ . A represented procedure was reported by Zhu, D.-G. and co-workers in *J. Org. Chem.* 2002, 67, 943-948.

B. Ortho <sup>125</sup>Iodination of phenols – This procedure allows for the incorporation of <sup>125</sup>I at the ortho position of a phenol as reported by Collier, T. L. and co-workers in *J. Labeled Compd Radiopharm.* 1999, 42, S264-S266.

5 C. Aryl and heteroaryl bromide exchange with <sup>125</sup>I – This method is generally a two step process. The first step is the conversion of the aryl or heteroaryl bromide to the corresponding tri-alkyltin intermediate using for example, a Pd catalyzed reaction [i.e. Pd(Ph<sub>3</sub>P)<sub>4</sub>] or through an aryl or heteroaryl lithium, in the presence of a tri-alkyltinhalide or hexaalkylditin [e.g., (CH<sub>3</sub>)<sub>3</sub>SnSn(CH<sub>3</sub>)<sub>3</sub>]. A represented procedure was reported by Bas, M.-D. and co-workers in *J. Labeled Compd Radiopharm.* 2001, 44, S280-S282.

10 A radio-labeled RUP25 compound of Formula (Ia) can be used in a screening assay to identify/evaluate compounds. In general terms, a newly synthesized or identified compound (i.e., test compound) can be evaluated for its ability to reduce binding of the “radio-labeled compound of Formula (Ia)” to the RUP25 receptor. Accordingly, the ability of a test compound to compete with the “radio-labeled compound of Formula (Ia)” for the binding to the RUP25 receptor directly  
15 correlates to its binding affinity.

The labeled compounds of the present invention bind to the RUP25 receptor. In one embodiment the labeled compound has an IC<sub>50</sub> less than about 500 μM, in another embodiment the labeled compound has an IC<sub>50</sub> less than about 100 μM, in yet another embodiment the labeled compound has an IC<sub>50</sub> less than about 10 μM, in yet another embodiment the labeled compound has  
20 an IC<sub>50</sub> less than about 1 μM, and in still yet another embodiment the labeled inhibitor has an IC<sub>50</sub> less than about 0.1 μM.

Other uses of the disclosed receptors and methods will become apparent to those in the art based upon, inter alia, a review of this disclosure.

As will be recognized, the steps of the methods of the present invention need not be  
25 performed any particular number of times or in any particular sequence. Additional objects, advantages, and novel features of this invention will become apparent to those skilled in the art upon examination of the following examples thereof, which are intended to be illustrative and not intended to be limiting.

## 30 EXAMPLES

The following Examples are provided for illustrative purposes and not as a means of limitation. One of ordinary skill in the art would be able to design equivalent assays and methods based on the disclosure herein, all of which form part of the present invention.

### 35 Example 1

**RODENT DIABETES MODELS**

Rodent models of type 2 diabetes associated with obesity and insulin resistance have been developed. Genetic models such as db/db and ob/ob [see Diabetes (1982) 31:1-6] in mice and fa/fa in Zucker rats have been developed for understanding the pathophysiology of disease and for testing candidate therapeutic compounds [Diabetes (1983) 32:830-838; Annu Rep Sankyo Res Lab (1994) 46:1-57]. The homozygous animals, C57 BL/KsJ-db/db mice developed by Jackson Laboratory are obese, hyperglycemic, hyperinsulinemic and insulin resistant [J Clin Invest (1990) 85:962-967], whereas heterozygotes are lean and normoglycemic. In the db/db model, mice progressively develop insulinopenia with age, a feature commonly observed in late stages of human type 2 diabetes when sugar levels are insufficiently controlled. Since this model resembles that of human type 2 diabetes, the compounds of the present invention are tested for activities including, but not limited to, lowering of plasma glucose and triglycerides. Zucker (fa/fa) rats are severely obese, hyperinsulinemic, and insulin resistant {Coleman, Diabetes (1982) 31:1; E Shafrir in Diabetes Mellitus, H Rifkin and D Porte, Jr, Eds [Elsevier Science Publishing Co, New York, ed. 4, (1990), pp. 299-340]}, and the fa/fa mutation may be the rat equivalent of the murine db mutation [Friedman et al, Cell (1992) 69:217-220; Truett et al, Proc Natl Acad Sci USA (1991) 88:7806]. Tubby (tub/tub) mice are characterized by obesity, moderate insulin resistance and hyperinsulinemia without significant hyperglycemia [Coleman et al, Heredity (1990) 81:424].

The present invention encompasses the use of compounds of the invention for reducing the insulin resistance and hyperglycemia in any or all of the above rodent diabetes models, in humans with type 2 diabetes or other preferred metabolic-related disorders or disorders of lipid metabolism described previously, or in models based on other mammals. Plasma glucose and insulin levels will be tested, as well as other factors including, but not limited to, plasma free fatty acids and triglycerides.

**In Vivo Assay for Anti-Hyperglycemic Activity of Compounds of the Invention**

Genetically altered obese diabetic mice (db/db) (male, 7-9 weeks old) are housed (7-9 mice/cage) under standard laboratory conditions at 22°C and 50% relative humidity, and maintained on a diet of Purina rodent chow and water *ad libitum*. Prior to treatment, blood is collected from the tail vein of each animal and blood glucose concentrations are determined using One Touch Basic Glucose Monitor System (Lifescan). Mice that have plasma glucose levels between 250 to 500 mg/dl are used. Each treatment group consists of seven mice that are distributed so that the mean glucose levels are equivalent in each group at the start of the study. db/db mice are dosed by micro-osmotic pumps, inserted using isoflurane anesthesia, to provide compounds of the invention, saline, or an irrelevant compound to the mice subcutaneously (s.c.). Blood is sampled from the tail vein at intervals thereafter and analyzed for blood glucose concentrations. Significant differences between groups (comparing compounds of the invention to saline-treated) are evaluated using Student t-test.

**Example 2****MOUSE ATHEROSCLEROSIS MODEL**

Adiponectin-deficient mice generated through knocking out the adiponectin gene have been shown to be predisposed to atherosclerosis and to be insulin resistant. The mice are also a suitable model for ischemic heart disease [Matsuda, M *et al.* J Biol Chem (2002) July, and references cited therein, the disclosures of which are incorporated herein by reference in their entirety].

Adiponectin knockout mice are housed (7-9 mice/cage) under standard laboratory conditions at 22°C and 50% relative humidity. The mice are dosed by micro-osmotic pumps, inserted using isoflurane anesthesia, to provide compounds of the invention, saline, or an irrelevant compound to the mice subcutaneously (s.c.). Neointimal thickening and ischemic heart disease are determined for different groups of mice sacrificed at different time intervals. Significant differences between groups (comparing compounds of the invention to saline-treated) are evaluated using Student t-test.

**Example 3*****In Vitro* Biological Activity**

A modified Flash Plate™ Adenylyl Cyclase kit (New England Nuclear; Cat. No. SMP004A) was utilized for direct identification of candidate compounds as agonists to hRUP25 in accordance with the following protocol. The term hRUP25 includes the human sequences found in GenBank Accession No. NM\_177551 for the nucleotide and GenBank Accession No. NP\_808219 for the polypeptide, and naturally-occurring allelic variants, mammalian orthologs, and recombinant mutants thereof.

CHO cells stably transfected with an expression vector encoding hRUP25 and cultured under condition permissive for cell surface expression of the encoded hRUP25 receptor were harvested from flasks *via* non-enzymatic means. The cells were washed in PBS and resuspended in the manufacturer's Assay Buffer. Live cells were counted using a hemacytometer and Trypan blue exclusion, and the cell concentration was adjusted to  $2 \times 10^6$  cells/ml. cAMP standards and Detection Buffer (comprising 2  $\mu$ Ci of tracer [ $^{125}$ I]-cAMP (100  $\mu$ l) to 11 ml Detection Buffer) were prepared and maintained in accordance with the manufacturer's instructions. Candidate compounds identified as per above (if frozen, thawed at room temperature) were added to their respective wells (preferably wells of a 96-well plate) at increasing concentrations (3  $\mu$ l/well; 12  $\mu$ M final assay concentration). To these wells, 100,000 cells in 50  $\mu$ l of Assay Buffer were added and the mixture was then incubated for 30 minutes at room temperature, with gentle shaking. Following the incubation, 100  $\mu$ l of Detection Buffer was added to each well, followed by incubation for 2-24 hours. Plates were counted in a Wallac MicroBeta™ plate reader using "Prot. #31" (as per manufacturer instructions).

Certain compounds of the invention have an EC<sub>50</sub> in the cAMP Whole Cell method of about 25  $\mu$ M or less.

**Example 4: In vitro Biological Activity****<sup>35</sup>S-GTP $\gamma$ S binding assay:**

Membranes prepared from Chinese Hamster Ovary (CHO)-K1 cells stably expressing the  
5 niacin receptor or vector control (7  $\mu$ g/assay) were diluted in assay buffer (100 mM HEPES, 100 mM  
NaCl and 10 mM MgCl<sub>2</sub>, pH 7.4) in Wallac Scintistrip plates and pre-incubated with test compounds  
diluted in assay buffer containing 40  $\mu$ M GDP (final [GDP] was 10  $\mu$ M) for ~ 10 minutes before  
addition of <sup>35</sup>S-GTP $\gamma$ S to 0.3 nM. To avoid potential compound precipitation, all compounds were  
10 first prepared in 100% DMSO and then diluted with assay buffer resulting in a final concentration of  
3% DMSO in the assay. Binding was allowed to proceed for one hour before centrifuging the plates  
at 4000 rpm for 15 minutes at room temperature and subsequent counting in a TopCount scintillation  
counter. Non-linear regression analysis of the binding curves was performed in GraphPad Prism.

### Example 5

#### 5 In Vivo Animal Model

One utility of the compound of the present invention as a medical agent in the prophylaxis and treatment of a high total cholesterol/HDL-cholesterol ratio and conditions relating thereto is demonstrated by the activity of the compound in lowering the ratio of total cholesterol to HDL-cholesterol, in elevating HDL-cholesterol, or in protection from atherosclerosis in an *in vivo* pig model. Pigs are used as an animal model because they reflect human physiology, especially lipid metabolism, more closely than most other animal models. An illustrative *in vivo* pig model not intended to be limiting is presented here.

Yorkshire albino pigs (body weight  $25.5 \pm 4$  kg) are fed a saturated fatty acid rich and cholesterol rich (SFA-CHO) diet during 50 days (1 kg chow  $35 \text{ kg}^{-1}$  pig weight), composed of standard chow supplemented with 2% cholesterol and 20% beef tallow [Royo T., *et al.*, *European Journal of Clinical Investigation* (2000) 30:843-52; which disclosure is hereby incorporated by reference in its entirety]. Saturated to unsaturated fatty acid ratio is modified from 0.6 in normal pig chow to 1.12 in the SFA-CHO diet. Animals are divided into two groups, one group ( $n = 8$ ) fed with the SFA-CHO diet and treated with placebo and one group ( $n = 8$ ) fed with the SFA-CHO diet and treated with the compound ( $3.0 \text{ mg kg}^{-1}$ ). Control animals are fed a standard chow for a period of 50 days. Blood samples are collected at baseline (2 days after the reception of the animals), and 50 days after the initiation of the diet. Blood lipids are analyzed. The animals are sacrificed and necropsied.

Alternatively, the foregoing analysis comprises a plurality of groups each treated with a different dose of the compound. Preferred said doses are selected from the group consisting of: 0.1  $\text{mg kg}^{-1}$ , 0.3  $\text{mg kg}^{-1}$ , 1.0  $\text{mg kg}^{-1}$ , 3.0  $\text{mg kg}^{-1}$ , 10  $\text{mg kg}^{-1}$ , 30  $\text{mg kg}^{-1}$  and 100  $\text{mg kg}^{-1}$ . Alternatively, the foregoing analysis is carried out at a plurality of timepoints. Preferred said timepoints are selected from the group consisting of 10 weeks, 20 weeks, 30 weeks, 40 weeks, and 50 weeks.

#### 30 HDL-Cholesterol

Blood is collected in trisodium citrate (3.8%, 1:10). Plasma is obtained after centrifugation (1200 g 15 min) and immediately processed. Total cholesterol, HDL-cholesterol, and LDL-cholesterol are measured using the automatic analyzer Kodak Ektachem DT System (Eastman Kodak Company, Rochester, NY, USA). Samples with value parameters above the range are diluted with the solution supplied by the manufacturer and then re-analyzed. The total cholesterol/HDL-cholesterol ratio is determined. Comparison is made of the level of HDL-cholesterol between groups. Comparison is made of the total cholesterol/HDL-cholesterol ratio between groups.

Elevation of HDL-cholesterol or reduction of the total cholesterol/HDL-cholesterol ratio on administration of the compound is taken as indicative of the compound having the aforesaid utility.

#### Atherosclerosis

- 5           The thoracic and abdominal aortas are removed intact, opened longitudinally along the ventral surface, and fixed in neutral-buffered formalin after excision of samples from standard sites in the thoracic and abdominal aorta for histological examination and lipid composition and synthesis studies. After fixation, the whole aortas are stained with Sudan IV and pinned out flat, and digital images are obtained with a TV camera connected to a computerized image analysis system (Image
- 10   Pro Plus; Media Cybernetics, Silver Spring, MD) to determine the percentage of aortic surface involved with atherosclerotic lesions [Gerrity RG et al, *Diabetes* (2001) 50:1654-65; Cornhill JF et al, *Arteriosclerosis, Thrombosis, and Vascular Biology* (1985) 5:415-26; which disclosures are hereby incorporated by reference in their entirety]. Comparison is made between groups of the percentage of aortic surface involved with atherosclerotic lesions.
- 15           Reduction of the percentage of aortic surface involved with atherosclerotic lesions on administration of the compound is taken as indicative of the compound having the aforesaid utility.

#### **Example 6**

##### **Receptor Binding Assay**

- 20           In addition to the methods described herein, another means for evaluating a test compound is by determining binding affinities to the RUP25 receptor. This type of assay generally requires a radiolabelled ligand to the RUP25 receptor. Absent the use of known ligands for the RUP25 receptor and radiolabels thereof, compounds of Formula (Ia) can be labelled with a radioisotope and used in an assay for evaluating the affinity of a test compound to the RUP25 receptor.
- 25           A radiolabelled RUP25 compound of Formula (Ia) can be used in a screening assay to identify/evaluate compounds. In general terms, a newly synthesized or identified compound (i.e., test compound) can be evaluated for its ability to reduce binding of the "radiolabelled compound of Formula (Ia)" to the RUP25 receptor. Accordingly, the ability to compete with the "radio-labelled compound of Formula (Ia)" or Radiolabelled RUP25 Ligand for the binding to the RUP25 receptor
- 30           directly correlates to its binding affinity of the test compound to the RUP25 receptor.

#### **ASSAY PROTOCOL FOR DETERMINING RECEPTOR BINDING FOR RUP25:**

##### **A. RUP25 RECEPTOR PREPARATION**

- 293 cells (human kidney, ATCC), transiently transfected with 10 ug human RUP25 receptor
- 35   and 60 µL Lipofectamine (per 15-cm dish), are grown in the dish for 24 hours (75% confluency) with a media change and removed with 10 ml/dish of Hepes-EDTA buffer ( 20mM Hepes + 10 mM EDTA, pH 7.4). The cells are centrifuged in a Beckman Coulter centrifuge for 20 minutes, 17,000

rpm (JA-25.50 rotor). Subsequently, the pellet is resuspended in 20 mM Hepes + 1 mM EDTA, pH 7.4 and homogenized with a 50- ml Dounce homogenizer and again centrifuged. After removing the supernatant, the pellets are stored at -80°C, until used in binding assay. When used in the assay, membranes are thawed on ice for 20 minutes and then 10 mL of incubation buffer (20 mM Hepes, 1 mM MgCl<sub>2</sub>, 100 mM NaCl, pH 7.4) added. The membranes are vortexed to resuspend the crude membrane pellet and homogenized with a Brinkmann PT-3100 Polytron homogenizer for 15 seconds at setting 6. The concentration of membrane protein is determined using the BRL Bradford protein assay.

#### B. BINDING ASSAY

For total binding, a total volume of 50 µL of appropriately diluted membranes (diluted in assay buffer containing 50mM Tris HCl (pH 7.4), 10mM MgCl<sub>2</sub>, and 1mM EDTA; 5-50ug protein) is added to 96-well polypropylene microtiter plates followed by addition of 100 µL of assay buffer and 50 µL of Radiolabelled RUP25 Ligand. For nonspecific binding, 50 µL of assay buffer is added instead of 100 µL and an additional 50 µL of 10 µM cold RUP25 is added before 50 µL of Radiolabelled RUP25 Ligand is added. Plates are then incubated at room temperature for 60-120 minutes. The binding reaction is terminated by filtering assay plates through a Microplate Devices GF/C Unifilter filtration plate with a Brandell 96-well plate harvester followed by washing with cold 50 mM Tris HCl, pH 7.4 containing 0.9% NaCl. Then, the bottom of the filtration plate are sealed, 50 µL of Optiphase Supermix is added to each well, the top of the plates are sealed, and plates are counted in a Trilux MicroBeta scintillation counter. For compound competition studies, instead of adding 100 µL of assay buffer, 100 µL of appropriately diluted test compound is added to appropriate wells followed by addition of 50 µL of Radiolabelled RUP25 Ligand.

#### C. CALCULATIONS

The test compounds are initially assayed at 1 and 0.1 µM and then at a range of concentrations chosen such that the middle dose would cause about 50% inhibition of a Radio-RUP25 Ligand binding (i.e., IC<sub>50</sub>). Specific binding in the absence of test compound (B<sub>0</sub>) is the difference of total binding (B<sub>T</sub>) minus non-specific binding (NSB) and similarly specific binding (in the presence of test compound) (B) is the difference of displacement binding (B<sub>D</sub>) minus non-specific binding (NSB). IC<sub>50</sub> is determined from an inhibition response curve, logit-log plot of % B/B<sub>0</sub> vs concentration of test compound.

K<sub>i</sub> is calculated by the Cheng and Prustoff transformation:

$$K_i = IC_{50} / (1 + [L]/K_d)$$

Where [L] is the concentration of a Radio-RUP25 Ligand used in the assay and K<sub>d</sub> is the dissociation constant of a Radio-RUP25 Ligand determined independently under the same binding conditions.

#### D. ALTERNATIVE BINDING ASSAY PROCEDURE

H-Nicotinic acid binding competition assay.

CHO-KI cells stably expressing the niacin receptor were used to make membrane for binding analysis. Cells were grown to ~80% confluence in growth medium (F-12 Kaighn's modified medium (ATCC, #30-2004) containing 10% FBS (GIBCO, #10438-026), 1 mg/ml G418 (GIBCO, #10131-027) and 1X Pen-Strep (Sigma P-0871), harvested by scraping, and centrifuged at 12 000 X g, 4° Celsius, 10 minutes. Cell pellets were resuspended in harvest buffer (20 mM HEPES, 10 mM EDTA, pH 7.4) and homogenized with 4 X 10 second bursts of a 12 mm Polytron homogenizer, setting 5. Lysate was centrifuged at 2 000 X g, 4°, 10 minutes to remove unlysed cells and nuclei, and the resulting supernatant centrifuged at 39 000 X g, 4°, 45 minutes to pellet membranes. The resulting pellet was resuspended in wash buffer (20 mM HEPES, 0.1 mM EDTA, pH 7.4), homogenized with 3 X 10 second bursts of a 12 mm Polytron, setting 4, and re-centrifuged at 39 000 X g, 4°, 45 minutes. The resulting pellet was resuspended in wash buffer and stored in liquid nitrogen before use. The concentration of membrane proteins in this preparation was determined using the Pierce BCA protein assay, with BSA as a standard.

Equilibrium binding of <sup>3</sup>H-nicotinic acid was performed in 96-well polypropylene plates. Reactions contained 140 µL membrane diluted in assay buffer (20 mM HEPES, pH 7.4, 1 mM MgCl<sub>2</sub>, and 0.01% CHAPS; 15-30 µg membrane protein/assay), 20 µL test compounds diluted in assay buffer (compound stocks were in 100% DMSO; final DMSO concentration in the assay was 0.25%), and 40 µL 250 nM tritiated niacin ([5, 6-<sup>3</sup>H] – nicotinic acid: American Radiolabeled Chemicals, Inc., 20 µM in ethanol; final ethanol concentration in each assay was 1.5%). Non-specific binding was determined in the presence of 250 µM unlabeled nicotinic acid. After mixing at 3-4 hours at room temperature, reactions were filtered through Packard Unifilter GF/C plates using a Packard Harvester, and washed with 8 X 200 µL ice-cold binding buffer. Plates were dried overnight and their backs sealed using PerkinElmer tape designed for GF/C plates. 40 µL PerkinElmer Microscint-20 scintillation fluid was added to each well, the tops sealed, and plates analyzed in a Packard TopCount scintillation counter.

Calculations were performed as in C above.

Certain compounds of the invention have an EC<sub>50</sub> in the <sup>3</sup>H-nicotinic acid binding competition assay within the range of about 10 to about 100 µM. More advantageous compounds of the invention have an EC<sub>50</sub> value in this assay within the range of about 1 to about 10 µM. Still more advantageous compounds have an EC<sub>50</sub> value in this assay of less than about 1 µM.

#### Example 7: Flushing *via* Laser Doppler

- Procedure – Male C57Bl6 mice (~25g) are anesthetized using 10mg/ml/kg Nembutal sodium. When antagonists are to be administered they are co-injected with the Nembutal anesthesia. After ten minutes the animal is placed under the laser and the ear is folded back to expose the ventral side. The laser is positioned in the center of the ear and focused to an intensity of 8.4-9.0 V (with is generally ~4.5cm above the ear). Data acquisition is initiated with a 15 by 15 image format, auto interval, 60 images and a 20sec time delay with a medium resolution. Test compounds are administered following the 10th image *via* injection into the peritoneal space. Images 1-10 are considered the animal's baseline and data is normalized to an average of the baseline mean intensities.

**Example 8: Inhibition of Free Fatty-Acid Production, *in vivo*, in Catheterized Male Sprague-Daly Rats**

- Non-esterified free-fatty acid (NEFA) assays are performed on serum derived from live, freely moving rats. Jugular vein catheters are surgically implanted into the jugular veins and the animals are allowed to recover at least 48hr post surgery. Food is removed from the animals approximately 16 hours prior to the assay. A draw of ~200 $\mu$ l blood is pulled from the catheter and represents the baseline NEFA serum sample. Drug is administered intra-peritoneally (IP) at various concentrations to individual rats and then ~200 $\mu$ l blood draws are pulled from the catheter at the indicated time points for further NEFA analysis. NEFA assays are performed according to the manufacturer's specifications (Wako Chemicals, USA; NEFA C) and free fatty acid concentrations are determined *via* regression analysis of a known standard curve (range of known free fatty acids). Data is analyzed using Excel and PrismGraph.

**Example 9.1: Preparation of (1aR, 5aR)-(+)-4-(2H-Tetrazol-5-yl)-1a,3,5,5a-tetrahydro-1H-2,3-diaza-cyclopropa[a]pentalene (Compound 4).**

**Step A: Preparation of bicyclo[3.1.0]hexan-2-ol.**

LiTMP was generated by addition of *n*-BuLi (2.5 M in hexanes, 143 mL, 358 mmol) to a stirred solution of TMP (50.7 g, 359 mmol) in *t*-BuOMe (1.0 L) at -78 °C. The light yellow LiTMP solution was slowly warmed to 0 °C over 45 min. To a stirred solution of (*R*)-2-but-3-enyl-oxirane (17.6 g, 179 mmol, Schaus, S. E.; *et al. J. Am. Chem. Soc.* 2002, 124, 1307) in *t*-BuOMe (500 mL) at 0 °C was added the LiTMP solution dropwise *via* cannula over 50 min. The resultant mixture was stirred at ambient temperature for 18 h then quenched with MeOH (40 mL). The reaction was concentrated to a total volume of 600 mL and the solution was washed with HCl (1*N* aq., 3 × 350 mL) and brine (300 mL). The organics were dried over MgSO<sub>4</sub>, filtered, and concentrated (90 mmHg, 25 °C bath temperature) to give bicyclo[3.1.0]hexan-2-ol as a light yellow oil. The spectral data for bicyclo[3.1.0]hexan-2-ol was similar to the reported literature data, Hodgson, D. M.; Chung, Y. K.; Paris, J.-M. *J. Am. Chem. Soc.* 2004, 126, 8664.

**Step B: Preparation of Bicyclo[3.1.0]hexan-2-one.**

TPAP (1.88 g, 5.35 mmol) was added to a stirring solution of bicyclo[3.1.0]hexan-2-ol (10.5 g, 107 mmol), NMO (25.1 g, 214 mmol), and powdered 4Å MS (20 g) in CH<sub>2</sub>Cl<sub>2</sub> (500 mL) at ambient temperature. The mixture was stirred for 2.5 h and filtered through silica gel (80 cm × 12 cm) and eluted with Et<sub>2</sub>O/CH<sub>2</sub>Cl<sub>2</sub> (1 : 1). The organic solvent was carefully evaporated *in vacuo* (100 mmHg, 25 °C bath temperature) to give bicyclo[3.1.0]hexan-2-one. Spectral data were similar to those previously reported for *rac*-bicyclo[3.1.0]hexan-2-one (Newman-Evans, R. H.; Simon, R. J.; Carpenter, B. K. *J. Org. Chem.* 1990, 55, 695).

10 **Step C: Preparation of 1a,2,5,5a-Tetrahydro-1H-2,3-diaza-cyclopropa[a]pentalene-4-carboxylic acid ethyl ester.**

The reaction was stirred for 3.5 h at which time hydrazine hydrochloride (7.90 g, 115 mmol) in H<sub>2</sub>O (40 mL) was added. The reaction mixture was stirred for 20 h at rt and acidified to pH ~3 by the addition of HCl (6N aq.). The volatiles were removed *in vacuo* and the resulting solid was diluted with EtOAc (500 mL) and H<sub>2</sub>O (500 mL). The layers were separated and the aqueous phase was back-extracted with EtOAc (300 mL). The combined organics were washed with brine (400 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated to a crude oil that was determined to be approximately 75-80% pure (wt./wt.) ester by <sup>1</sup>H NMR. The title compound was used directly in the next reaction (aminolysis) without further purification. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 10.55 (1H, bs), 4.32 (2H, q, *J* = 6.8 Hz), 2.96 (1H, dd, *J* = 16.8, 6.0 Hz), 2.80 (1H, d, *J* = 17.2 Hz), 2.23-2.13 (2H, m), 1.35 (3H, t, *J* = 7.2 Hz), 1.15 (1H, m), 0.34 (1H, m). <sup>13</sup>C APT NMR (partial) (100 MHz, CDCl<sub>3</sub>): δ up: 127.4, 61.2, 26.8, 16.8; down: 23.0, 15.4, 14.5. HPLC/MS: Discovery® C18 column (5μ, 50 × 2.1 mm), 5% v/v CH<sub>3</sub>CN (containing 1% v/v TFA) in H<sub>2</sub>O (containing 1% v/v TFA) gradient to 99% v/v CH<sub>3</sub>CN in H<sub>2</sub>O, 0.75 mL/min, *t*<sub>r</sub> = 1.62 min, ESI<sup>+</sup> = 193.1 (M + H).

To a solution of the ester from Step C (14.2 g, 73.9 mmol) in dioxane (140 mL) was added ammonium hydroxide (28%  $\text{NH}_3$  in  $\text{H}_2\text{O}$ , 750 mL). The mixture was placed in a 1000 mL pyrex bottle and agitated on a shaker plate for 22 h at rt. The mixture was concentrated *in vacuo* to a total volume of 100 mL at which time a light yellow precipitate was evident. The mixture was filtered and the solid was washed with  $\text{H}_2\text{O}$  ( $2 \times 100$  mL). Further drying of the solid *in vacuo* gave 1a,2,5,5a-tetrahydro-1H-2,3-diaza-cyclopropa[a]pentalene-4-carboxylic acid amide [HPLC/MS: Discovery<sup>®</sup> C18 column ( $5\mu$ ,  $50 \times 2.1$  mm), 5% v/v  $\text{CH}_3\text{CN}$  (containing 1% v/v TFA) in  $\text{H}_2\text{O}$  (containing 1% v/v TFA) gradient to 99% v/v  $\text{CH}_3\text{CN}$  in  $\text{H}_2\text{O}$ , 0.75 mL/min,  $t_r = 1.09$  min,  $\text{ESI}^+ = 164.0$  ( $\text{M} + \text{H}$ )] as a white solid.

The mixture slowly became clear and the reaction stirred for 20 h at rt. The mixture was acidified to pH  $\approx 2$  by the addition of HCl (6N, aq.) and concentrated to dryness *in vacuo*. The resultant light yellow solid was washed with  $\text{NaHCO}_3$  (sat. aq., 100 mL) and  $\text{H}_2\text{O}$  (100 mL). Further drying of the solid *in vacuo* gave the benzylated product, 2-benzyl-1a,2,5,5a-tetrahydro-1H-2,3-diaza-cyclopropa[a]pentalene-4-carboxylic acid amide as a white solid.

A flask equipped with a drying tube under  $\text{N}_2$  atmosphere was charged with anhydrous DMF (50 mL). The flask was cooled to  $0^\circ\text{C}$  and thionyl chloride (4.84 mL, 66.5 mmol) was added dropwise over a period of 2 min. After stirring for an additional 10 min, a suspension of 2-benzyl-1a,2,5,5a-tetrahydro-1H-2,3-diaza-cyclopropa[a]pentalene-4-carboxylic acid amide, (14.0 g, 55.3 mmol) in DMF (90 mL) was added over 5 min using an addition funnel. The mixture was slowly warmed to rt and stirred for 20 min at which time additional thionyl chloride (3.05 mL, 41.9 mmol) was added as a pre-mixed solution in DMF (20 mL). The reaction was stirred for an additional 20 min and a second pre-mixed solution of thionyl chloride (6.0 mL, 82.5 mmol) in DMF (20 mL) was added. The reaction was stirred for an additional 15 min and  $\text{NaHCO}_3$  (sat. aq., 50 mL) was added.

##### General Reaction Scheme:

To a solution of 4,4'-di-*tert*-butyl-biphenyl (5eq.) in THF was added lithium wire (5 eq.) cut into small pieces at rt. The solution was vigorously stirred at 0 °C for 6 h and cooled down to –78 °C. F.; Xu, M.; Hartnett, J. C. *J. Am. Chem. Soc.* **2002**, *124*, 13121].
- The reaction was slowly warmed to rt and stirred a total of 3 h. The mixture was quenched with sat.  $\text{NH}_4\text{Cl}$ , and extracted with  $\text{Et}_2\text{O}$  (2 $\times$ ). The organics were washed with  $\text{H}_2\text{O}$ , and brine, dried over  $\text{MgSO}_4$ , filtered, and concentrated. The material was purified by silica gel chromatography (5% EtOAc in hexanes gradient to 15% EtOAc in hexanes) to give (R)-4-(hex-3-ynyl)-2,2-dimethyl-1,3-dioxolane as a clear oil.  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  4.19 (1H, m), 4.08 (1H, dd,  $J = 8.0, 6.0$  Hz), 3.58 (1H, dd,  $J = 7.6, 6.8$  Hz), 2.26 (2H, m), 2.15 (2H, qt,  $J = 5.2, 2.4$  Hz), 1.81 (1H, m), 1.68 (1H, m), 1.40 (3H, s), 1.36 (3H, s), 1.11 (3H, t,  $J = 7.6$  Hz).

- To a solution of (R)-4-(hex-3-ynyl)-2,2-dimethyl-1,3-dioxolane (6.49g, 35.6 mmol) in hexanes (100 mL) was added 5% palladium on  $\text{BaSO}_4$  (1.14 g), and quinoline (freshly distilled from Zn dust, 0.631 mL, 5.34 mmol). The flask was then purged with  $\text{H}_2$  and stirred under an  $\text{H}_2$  atmosphere for 2 h. The reaction mixture was filtered through celite and washed sequentially with 1N HCl (2 $\times$ ) and brine. The organics were dried over  $\text{MgSO}_4$ , filtered, and concentrated to give (R,Z)-4-(hex-3-enyl)-2,2-dimethyl-1,3-dioxolane which was used without further purification. This material contained approximately 7% of the *trans* olefin isomer which was carried through the synthetic route as a mixture (data not shown for minor isomer) eventually producing the corresponding *exo*-ethyl pyrazole acid derivative after separation by reverse phase HPLC (*vide infra*).

Purification by silica gel chromatography (2% Et<sub>2</sub>O in pentane gradient to 8% Et<sub>2</sub>O in pentane) gave (*R,Z*)-2-(hex-3-enyl)oxirane. It was determined that slight racemization occurred at this step (98% ee to 84% ee). In order to ensure optical purity the enantioenriched product was further resolved using Jacobsen's hydrolytic kinetic resolution (HKR, Step E). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 5.41 (1H, m), 5.35 (1H, m), 2.93 (1H, m), 2.75 (1H, dd, *J* = 5.2, 4.4 Hz), 2.49 (1H, dd, *J* = 5.2, 2.8 Hz), 2.20 (2H, q, *J* = 6.8 Hz), 2.06 (2H, quin, 7.6 Hz), 1.59 (2H, m), 0.97 (3H, t, *J* = 7.6 Hz).

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2005/046599

### Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 45-56(part)  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 45-56 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
